

Additional information on MDMA research that Fabrice provided.

“So, here’s the scoop: Initial doses per Experimental Session include 80 mg or 120 mg of MDMA (compounded with mannitol and magnesium stearate), followed 1.5 to 2 hours later by a supplemental half-dose (40 or 60 mg). Total amounts of MDMA to be administered per Experimental Session range from 80 mg to 180 mg. In comparison, different labs have analyzed **street samples** and have found that the drug sold as “ecstasy” may be MDMA, MDEA, MDA, PMA, MBDB, ephedrine or varying mixtures of these. The typical dosage range of MDMA for recreational use varies from 50 mg to 150 mg, but the amount per tablet in different batches of tablets may vary 70-fold or more, from almost zero to well over 100 mg.”
